Assignment of milestone 2 activities

I.Introduction to our assignment

We (Jingzu Ge, Yunlong Wang, Yutian Wang) submitted our assignment(Five Chess Game/Gobang) on GitLab. Each of us submitted our homework in our own branch. But in the end, I integrated the homework of three people in the branch of (Yunlong Wang).

Each of us had a different division of labor, and our work was carried out on separate branches corresponding to our respective responsibilities: [1.Jingzu Ge](#): Responsible for the algorithms and logic related to the Gomoku game. [2.Yunlong Wang](#): Mainly focused on drawing simple structural graphics, such as the basic form, the basic chessboard layout, and necessary buttons. The initial chessboard was created first, and two complete chessboards will be developed in later

tasks. [3.Yutian Wang](#): Handled the control aspects.

II . Future goals(for milestone 3)

In the future. We want:

For Yunlong Wang: [1](#).Improve the timing interface. [2](#). AI mode selection interface [3](#). Item battle interface [4](#). Challenge mode interface (challenge mode) [5](#). Interface beautification

For Jingzu Ge: [1](#). Difficult AI implement AI based on scoring table [2](#). The judgment of the outcome of the combination mode ensures that the combined chess pieces (11/12) can correctly participate in the judgment of the five sons in a row [3](#). Residual solution verify whether the provided method Boolean solveendgame (board, color) returns a one-step win [4](#). Props effect implementation provides the method applyitem (itemtype) to modify the game state.

For Yutian Wang: [1](#). Timer control logic provides starttimer(), pausetimer(), switchtimer() [2](#). Mode switching state machine

management switching between classic/merge/challenge/prop modes 3. Online mode foundation if you want to do online, you need to control sending/receiving data 4. Turn control enhancement additional turn or skip turn caused by processing props.

III.Our branch location (on gitlab)

In order to intuitively display the branches of each of us, the following is a picture introduction:

Jingzu Ge did “Algorithm-and-logic” this branch.

Yutian Wang did “Controller” this branch.

Yunlong Wang did “Yunlong” this branch.

“master” this branch is out-dating.

Problems we encountered in programming and design.

1. Our AI model is too simple. We tried a harder AI model, but encountered a lot of errors. So we made the most basic non automatic AI mode (which means you can click the button all the time to run AI mode when you start the game). We will be more perfect in the future homework.
2. When it is difficult to make merge, the code controlled by the chessboard is forgotten to be modified so that the merge cannot run normally. At that time, we just blindly modified the algorithm file and ignored the modification of the chessboard interface.
3. The code is often repeated or misspelled when writing words, and many careless errors have occurred.
